Six Projects on Accessory Dwelling

ANDREW COLOPY

Six Projects on Accessory Dwelling is a recently concluded exhibition for a public audience that presented the work and research of an academic design-build program on the topic of accessory dwellings. The exhibit featured a recently completed accessory dwelling, +House, designed and constructed by students over the course of four semesters and a concluding summer. The show also included speculative design proposals completed in partnership with a local non-profit art institution and a series of material investigations and large-scale prototypes completed over the course of a comprehensive design studio and subsequent seminar entitled Secondary and Paratype, respectively. The design and construction of the exhibition tool was completed as part of the program, and catalogs an increasingly important aspect of design-build pedagogy: connecting with a wider audience.

Given the anticipated audience, the exhibition aimed to be accessible to the general public while offering sufficient depth to be of interest to knowledgeable members of the profession. Here, the skills and work of design-build programs perfectly align with such aims, offering tangible and engaging means to connect large-scale constructions to more abstract modes of representation.

Given the topic, the design of the exhibit first sought to give the visitor a true feel for the scale of the modest +House, a 360 square foot accessory dwelling built for counselors at a local non-profit youth outreach program. Within the space of a hosting art center, the four exterior walls of the +House were reconstructed at one-to-one scale from lightweight metal studs and laterally braced by partial OSB sheathing. On the entry-facing outer wall, an 8’x8’ map of the metropolitan area identified all viable accessory dwelling sites—in excess of 1 million. Inside, the full-scale plan of the +House was taped out on the floor and the wall opposite of the map provided plans, sections and construction photos of the project, recently completed.

The interior of the three remaining walls served to frame the urban context and neighborhood design response for each of five projects from the Secondary design studio. The aim was to bring the accessory dwelling into the public sphere with qualities that balance a distinct visual presence against a sympathetic urban character, and with forms that encourage a community of interactions among a network of dwellings. Through a small hole in the wall, visitors could look through to models on the opposing side and get some sense of what it might be like to have an ADU in their own backyard. On the exterior of the walls, these models were set alongside plans, sections, detailed models and walls sections to further illustrate the design and the construction logic of each proposal.

Two of the five projects later served to test alternative, non-standard construction logics in a seminar setting using adaptable digital models, or paratypes, to automate analysis and fabrication. Large scale tests of these proposed building systems along with animations were paired alongside their original design in the spaces resulting from the rotation of the gallery walls.

Six Projects on Accessory Dwelling

The Projects on Accessory Dwelling is a newly concluded exhibition for the fall season that presented the work of six certified under-explored design projects on the topic of accessory dwelling. This collection of projects presented design work that can contribute to the expansion of the accessory dwelling typology. The exhibition was conceived as a platform for designers and architects to showcase their projects and engage in conversations about the future of accessory dwelling. The exhibition was divided into six sections, each dedicated to a different project, allowing visitors to experience the diversity of design approaches and gain insights into the potential of accessory dwelling.

The projects were selected based on their innovative design solutions and their potential to contribute to the future of accessory dwelling. Each project was presented through a physical installation, which allowed visitors to explore the design concepts and materials used. The exhibition also included a conversation series, where designers and architects presented their work and discussed the challenges and opportunities associated with accessory dwelling.

The exhibition was a success, attracting a large number of visitors who were interested in exploring the future of accessory dwelling. The feedback from the visitors was positive, with many expressing their interest in learning more about the projects and the potential for accessory dwelling to contribute to the sustainability of urban environments.

The exhibition closed with a roundtable discussion, where designers and architects shared their thoughts on the current state of accessory dwelling and their hopes for its future. The discussion highlighted the importance of accessory dwelling in addressing the housing crisis and the need for innovative design solutions to meet the needs of a changing society.

The exhibition was a great opportunity for designers and architects to showcase their work and engage in conversations about the future of accessory dwelling. The feedback from the visitors was positive, with many expressing their interest in learning more about the projects and the potential for accessory dwelling to contribute to the sustainability of urban environments.
